

Inicare Nura[®]

Automating vital signs monitoring for the general ward

Up to **19 %** of ICU patients are readmitted to intensive care¹

Post-ICU monitoring results in a decrease in the number of patient being readmitted to intensive care units².

If patient deterioration after surgery is noticed too late this will lead to (re)admittance to ICU at significant higher cost or even be fatal for the patient. Therefore monitoring patient vital signs is crucial and currently done manually at low acuity wards.

On many wards it is only feasible to perform one set of vital sign observations once per nursing shift and increasing the intensity of vital sign monitoring by more frequent nurse rounds is severely limited by the availability of sufficient numbers of trained nurses and budget constraints.

If only there was a way to automate these repetitive and time consuming tasks. Now there is.

How We Help You

Inicare Nura helps to continuously monitor these patients automatically, allowing timely and effective intervention when needed and reduce ICU readmittance rate.

Inicare Nura automates vital sign observations in a hospital ward*. Potential post-surgery complications are detected sooner, enabling healthcare professionals to intervene at an early stage. The result is better patient outcome and reduced cost of care.

Inicare Nura is the only device that can measure heart rate, blood pressure, temperature and saturation from a single location on the body, without the use of wires. It guarantees patient hygiene, is easy to use for nursing staff and can be rolled out throughout the hospital without costly infrastructure investments.

With Inicare Nura You Can

Monitor a patient's vital function with ease of use

Read vital signs derived from a single location on the body

Ensure patient hygiene with the disposable smart strap

Integrate with hospital IT over HL7

Save significant upfront infrastructure investment

Inicare Solutions

Home Care

Solutions designed to monitor vital signs in a personalized homecare setting to enable early detection or tracking of chronic disease.

Professional Care

Innovative bedside monitoring solutions for use in the clinic or rehabilitation center

Inicare solutions are currently under development and to date not commercially available. No rights can be claimed based on the contents of this leaflet. References are on file with Inicare.
